

Experiment No. 1

Title: Interpretation of problem statement and Identification of test cases for given problem statement

Batch: A2**Roll No: 16010421059****Experiment No.:1**

Aim: To interpret given problem statement and identify test cases for given problem statement

Resources needed: Text Editor, C/C++ IDE

Theory:

In competitive programming the problem statement is mostly given pertaining to real-world scenario. Along with input and output information, constraints on input/output are also given most of the times with the problem statement. Hence in competitive programming to get started with a problem, the first step is to read and understand the problem statement and given information and find the following details from it:

1. Identify the input values
2. Identify the constraints on input
3. Identify the output values
4. Identify the constraints on output

Along with problem statement and constraints information, input format and output format information is also given. To get a clear understanding of these formats, sample input values and it's corresponding output values are also given. We refer to these values as sample test cases.

A Test Case is some sample input value and it's expected out value. In competitive programming, with every problem statement, some sample test cases are given most of the times. But these sample test cases do not cover all the general and special cases. Since the competitive programming platforms evaluate the solution based on test cases, it is essential to identify the general and special test cases for the problem statement under consideration. Special Cases mostly require special handling in the solution.

Test Cases can be identified using following approach:

1. Random Value Test Cases – Here some random values of input and it's corresponding output within the given input/output constraints can be considered
2. Minimal Value Test Cases – Here considering factors, such as minimum number of total input values or minimum possible value for a input, special cases can be identified
3. Maximal Value Test Cases - Here considering factors, such as maximum number of total input values or maximum possible value for a input, special cases can be identified. These test cases also help to determine problems like integer overflow,

crash point of solution, maximum running time and memory requirement of the solution and so on.

Activity:

Consider the following problem statement and other information provided along with it:

Problem

You are provided an array of size that contains non-negative integers. Your task is to determine whether the number that is formed by selecting the last digit of all the N numbers is divisible by 10.

Input format

- First line: A single integer N denoting the size of array A
- Second line: N space-separated integers.

Output format

If the number is divisible by 10, then print 'Yes'. Otherwise, print 'No'

Constraints

$$1 \leq N \leq 10^5$$

$$0 \leq A[i] \leq 10^5$$

Sample Input	Sample Output
5 45 23 65 22 74	No

Task 1:

Identify the following from the given information:

1. Input values
2. Constraints on input values
3. Output values
4. Constraints on output values
5. Specified format for input values
6. Specified format for output values

Task 2:

Identify general and special test cases for given problem statement. List down in all 10 - 12 test cases in table format as shown:

Sr. No.	Sample Input	Sample Output	Description	Test Case Type (general/special)
1.	5 45 23 65 22 74	No	array with 5 integer numbers	general
2.

Solution:

INPUT:

```
#include <stdio.h>
```

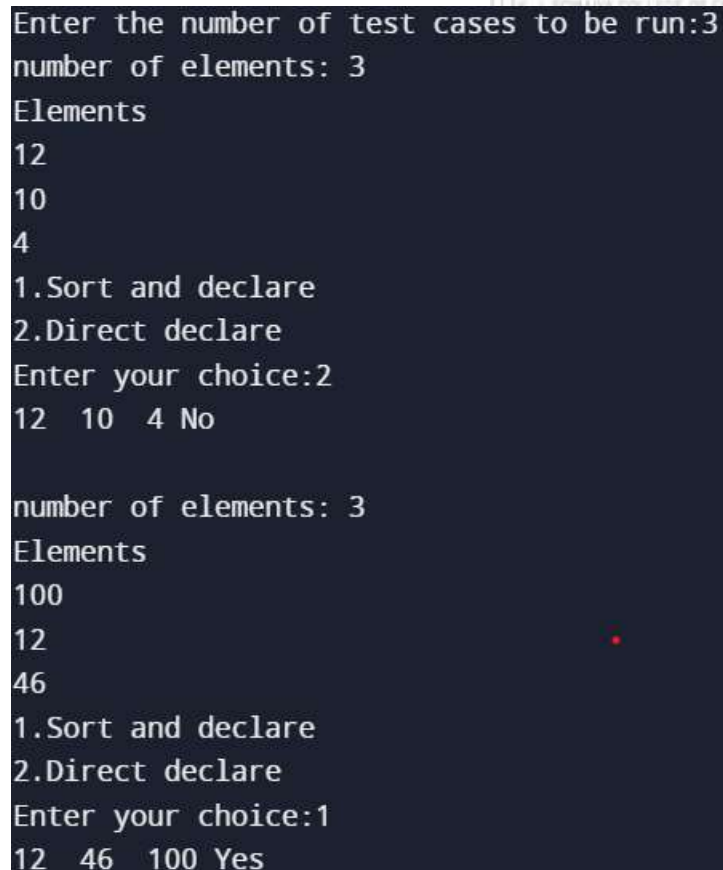

```
void sort(int n,int arr[]){  
    int i,j,temp;  
    for (i = 0; i < n - 1; i++){  
        for (j = 0; j < n - i - 1; j++){  
            if (arr[j] > arr[j + 1]){  
                temp=arr[j];  
                arr[j]=arr[j+1];  
                arr[j+1]=temp;  
            }  
        }  
    }  
}
```

```
void declare(int size, int arr[100]){  
    int i;  
    for(i=0; i<=size-1; i++){  
        printf(" %d ",arr[i]);  
    }  
    if(arr[size-1]%10==0){  
        printf("Yes");  
    }  
    else{  
        printf("No");  
    }  
}
```

```
int main()  
{  
    int a[100];  
    int i,n,c;  
    printf("number of elements: ");  
    scanf("%d", &n);  
    printf("Elements");  
    for(i=0;i<=n-1;i++){
```

```
scanf("%d",&a[i]);}  
printf("1.Sort and declare\n2.Direct declare\nEnter your choice:");  
scanf("%d",&c);  
switch(c){  
    case 1:  
        sort(n,a);  
        declare(n,a);  
        break;  
    case 2:  
        declare(n,a);  
        break;  
    default:  
        printf("INVALID INPUT!");  
}  
}
```

OUTPUT:

```
Enter the number of test cases to be run:3  
number of elements: 3  
Elements  
12  
10  
4  
1.Sort and declare  
2.Direct declare  
Enter your choice:2  
12 10 4 No  
  
number of elements: 3  
Elements  
100  
12  
46  
1.Sort and declare  
2.Direct declare  
Enter your choice:1  
12 46 100 Yes
```

```
number of elements: 4
Elements
12
65
78
89
1.Sort and declare
2.Direct declare
Enter your choice:3
INVALID INPUT|
```

Outcomes:

CO1. Inculcate the best practices that are essential for competitive programming

Post Lab Questions:

Consider the given problem statement and related information:

Problem

You have been given a positive integer N where $1 \leq N \leq 12$. You need to find and print the Factorial of this number.

Input Format

The first and only line of the input contains a single integer N denoting the number whose factorial you need to find.

Output Format

Output a single line denoting the factorial of the number N .

Sample Input	Sample Output
3	6

Task 1:

Identify the following from the given information:

1. Input values
2. Constraints on input values
3. Output values
4. Constraints on output values
5. Specified format for input values
6. Specified format for output values

Task 2:

Identify general and special test cases for given problem statement. List down in all 6-8 test cases in table format (refer activity section for table format of test cases)

INPUT:

```
#include <stdio.h>
```

```
void weights(int n, int w[]){
    int j;
    for(j = 0; j < n; j++){
        printf("enter the weight for item %d: ", j+1);
        scanf("%d", &w[j]);
    }
}
```

```

}
```

```

void bubble_sort(int n, int w[]){
    int temp, i, j;
    for(i = n-2; i >= 0; i--){
        for(j = 0; j <= i; j++){
            if(w[j] > w[j+1]){
                temp = w[j];
                w[j] = w[j+1];
                w[j+1] = temp;
            }
        }
    }
    printf("sorted array: ");
    for(i = 0; i < n; i++){
        printf("%d ", w[i]);
    }
    printf("\n\n");
}

```

```

int main() {
    int t, n, k, i, j;
    int w[10];
    printf("enter number of test cases: ");
    scanf("%d", &t);
    for(i = 0; i < t; i++){
        printf("enter the total number of items: ");
        scanf("%d", &n);
        printf("enter the items to be carried by the child: ");
        scanf("%d", &k);
        if(n%2 == 0 && k <= (n/2) - 1){
            weights(n, w);
            bubble_sort(n, w);
        } else if(n%2 != 0 && k <= (n/2)){
            weights(n, w);
            bubble_sort(n, w);
        } else{
            printf("invalid input");
            break;
        }
        printf("weights passed to child: ");
        for(j=0;j<=k-1;j++){
            printf("%d",w[j]);
        }
    }
}

```

```

    return 0;
}

```

OUTPUT:

```

enter number of test cases: 4
enter the total number of items: 3
enter the items to be carried by the child: 1
enter the weight for item 1: 12
enter the weight for item 2: 10
enter the weight for item 3: 2
sorted array: 2 10 12

enter the total number of items: 5
enter the items to be carried by the child: 2
enter the weight for item 1: 12
enter the weight for item 2: 34
enter the weight for item 3: 21
enter the weight for item 4: 10
enter the weight for item 5: 4
sorted array: 4 10 12 21 34

weights passed to child: 4 10
enter the total number of items: 7
enter the items to be carried by the child: 3
enter the weight for item 1: 12
enter the weight for item 2: 34
enter the weight for item 3: 1
enter the weight for item 4: 23
enter the weight for item 5: 45
enter the weight for item 6: 76
enter the weight for item 7: 21
sorted array: 1 12 21 23 34 45 76

weights passed to child: 1 12 21
enter the total number of items: 4
enter the items to be carried by the child: 2
invalid input

```

Conclusion: (Conclusion to be based on the objectives and outcomes achieved)

Interpreted the two given problem statement and identified test cases for given problem statements accordingly.
