

Experiment No._04

Title: Sensor control through web interface

K J Somarya College of Engineering

Batch: B2 Roll No.: 16010421059 Experiment No.:04

Aim: Sensor control through web interface

Resources needed: Internet, Raspberry Pi module, Sensors and Actuators

Theory:

Pre Lab/Prior Concepts:

The Internet of Things (IoT) is the network of physical devices, vehicles, home appliances and other items embedded with electronics, software, sensors, actuators, and connectivity which enable these objects to connect and exchange data. Each thing is uniquely identifiable through its embedded computing system but is able to inter-operate within the existing Internet infrastructure.

Role of Sensor in IoT:

Sensors are now found in a wide variety of applications, such as smart mobile devices, automotive systems, industrial control, healthcare, oil exploration and climate monitoring. Sensors are used almost everywhere, and now sensor technology is beginning to closely mimic the ultimate sensing machine the human being. The technology that allows this to happen is sensor fusion, which leverages a microcontroller to fuse the individual data collected from multiple sensors to get a more accurate and reliable view of the data than one would get by using the data from each discrete sensor on its own. Sensor fusion creates a situation in which the whole is much greater than the sum of its parts.

Role of Actuator in IoT:

An actuator is a component of a machine that is responsible for moving and controlling a mechanism or system, for example by opening a valve. In simple terms, it is a "mover".

An actuator requires a control device (controlled by control signal) and a source of energy. The control signal is relatively low energy and may be electric voltage or current, pneumatic, or hydraulic fluid pressure, or even human power. Its main energy source may be an electric current, hydraulic pressure, or pneumatic pressure. The control device is usually a valve. When it receives a control signal, an actuator responds by converting the source's energy into mechanical motion. In the electric, hydraulic, and pneumatic sense, it is a form of automation or automatic control.

The displacement achieved is commonly linear or rotational, as exemplified by linear motors and rotary motors, respectively. Rotary motion is more natural for small machines making large displacements. By means of a leadscrew, rotary motion can be adapted to function as a linear actuator (a linear motion, but not a linear motor).

Activity:

- 1. 1. Use any Web Interface to control sensors in IoT.
- 2. Control sensor / actuator with Web Interface, list out step performed, code, output and components used.

Results: (Program printout with output / Document printout as per the format) Main.py from flask import Flask, render_templateimport RPi.GPIO as GPIO import time sensorPin = 2 GPIO.setmode(GPIO.BCM) GPIO.setup(sensor, GPIO.IN) print("IR Sensor Ready.") print(" ") def readIRSensor(): val = "Object not detected"try: if GPIO.input(sensorPin) == GPIO.LOW:print("Object Detected") val = "Object not detected"except KeyboardInterrupt: GPIO.cleanup() return val $app = Flask(\underline{\hspace{1cm}} name\underline{\hspace{1cm}})$

```
@app.route('/')def
index():
     return render_template('index.html')
@app.route('/readSensor')def
readSensor():
     return readIRSensor()
if name == '
                          main
     app.run(debug=True, host='0.0.0.0', port=2450)
templates/index.html
<html>
        <head>
               <title>Hello</title>
                <style>
                       body {
                               background-color: black;color:
                               white;
                               display: flex;
                               justify-content: center; align-items:
                               center; text-align: center;
                       </style>
                      (A Constituent College of Somaiya Vidyavihar University)

Outcomes:

CO3: Realize design process of IoT applications and IoT challenges

Conclusion:

In this experiment, I attempted to integrate an IR sensor with a Flask web server running on a Raspberry Pi. The goal was to detect the presence of an object and reflect the result on a web page.
